Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                      AAWO2JIG-WO2332 represent the peptide portions of the beta-amyloid modulator compounds of the invention. Beta-amyloid peptide is a 4 kilodalton peptide that is the major protein component of amyloid plaques are present both in the brain lesions, and in the walls of cerebral blood vessels in Alzheimer's disease patients. The amyloid modulators of the invention comprise an amyloidogenic protein or peptide (such as this sequence) coupled directly or indirectly to at clear one modifying group. The modifying group is preferably a cyclic, heterocyclic, or polycyclic group, such as declain, a cholamyl group, a cherrocyclic, or poptides when contacted with a cholamyl group, a chounds then modulate the agreegation of these sequences to natural amyloid proteins or peptides. The modulator compounds can be used in the treatment of disorders associated with amyloidosis, such as in the treatment of disorders associated with amyloidosis, such as in the treatment of disorders associated with amyloidosis, scrapic, bovine spongiform encephalopathy, familial amyloid cardiomyopathy, creutzfeldt-Jakob disease, adult-onset diabetes, insulinoma, familial Mediterranean fever, familial amyloid compounds and deafness, neceival nemorrhage and other types of amyloidosis. Pre modulators are also useful for the treatment of disorders associated with beta-amyloidosis, especially creatment of disorders associated with beta-amyloidosis, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Amyloid beta peptide; Alzheimer's disease; polymerisation; aggregation; positron emission tomography; PET; Down's syndrome; amyloidosis.

```
This sequence represents a fragment of the amyloid beta peptide. The invention relates to the use of peptide compounds for inhibition of invention relates to the use of peptide (ABP), as model substances for polymerisation of amyloid beta peptide (ABP), as model substances for synthesis of ABP-ligands for inhibition of polymerisation of ABP, as a cool for the identification of other organic compounds with similar through properties, or as ligands in positron emission tomography. The peptides may be used in treatment of amyloidosis, for treatment or or prevention of demens in patients with Down's syndrome, for treatment or prevention of hereditary cerebral haemorrhage with amyloidosis (Dutch CT type) or for the prevention of fibril formation of human amyloid protein. They can also be used for identifying other molecules with similar properties and/or as ligands for detection of amyloid deposits using e.g. positron emission tomography. New conjugates are disclosed which are of formula A-2, in which: A is (1) a cyclosporin A analogue described in AAW29087 or (2) an FK506 binding peptide inhibitor; and Z is a polypeptide comprising 5 or more contiguous residues of A-beta peptide. The compounds are novel chemical inducers of dimerization which are non-immunosuppressive and which are inhibitors of A-beta peptide aggregation and deposition in amyloid plaques. The adverse consequences of amyloid plaque formation can be prevented or ameliorated by sequestering the A-beta peptide in monomeric form with a conjugate which links the A-beta peptide in monomeric form with a conjugate mechanism to minimize the mount of free A-beta available for fibril formation and deposition. The compounds can be used for the treatment of Alzheimer, A-disease, multiple sclerosis and amyotrophic lateral sclerosis
                                                                                          A-b-binding peptide conjugates and CSA analogs - useful in treatment deuro pojical diseases e.g. Alzheimer's disease, Multiple Sclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 6;

New peptide(s) derived from beta-amyloid peptide that inhibit amyloid aggregation - and neurotoxicity, specifically for treatment and prevention of Alzheimer's disease.

Example 12; Col 64; 52pp; English.

The present invention describes beta-amyloid peptide (bAP) derivatives. The bAP derivatives inhibit aggregation of amyloidogenic proteins and peptides, specifically bAP, and their neurotoxicity, so are useful for treating and preventing any disease involving amyloidosis, specifically Alzheimer's disease but also Down's syndrome, familial amyloid polyneuropathy or cardiomyopathy, bovine spongiform encephalopathy and Creutzfeldt-Jakob disease. The bAP derivatives are also used to diagnose these diseases, in vitro or in vivo, by detecting bhinding of bAP to labelled bAP derivatives. Some bAP derivatives inhibit bAP aggregation even when bAP is present in molar excess. The present sequence represents a bAP derivative

Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.

Claim 7; Page 26; 46pp; English.

Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB4847-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid protein

The present invention describes an amyloid modulator compound (1) comprising an aggregation core domain and a modifying group attrached to it. (1) has nootropic, neuroprotective, immunosuppressive, antimicrobial, antidiabetic, antipyretic, dermatological, cardiovascular, nephrotropic and auditory activities, and can be used as a natural amyloid aggregation
amyloid nephropathy with urticaria and deafness (Muckle-Wells syndrome), hereditary cerebral haemorrhage with amyloidosis of Icelandic type, amyloidosis associated with long term haemodialysis, hereditary non-neuropathic systemic amyloidosis (familial amyloid polyneuropathy III), familial amyloidosis of Finnish type, amyloidosis associated with medullary carcinoma of the thyroid, fibrinosen-associated hereditary renal amyloidosis and lysozyme-associated hereditary systemic amyloidosis. The compound is capable of altering and inhibiting beta-amyloid protein (beta-Ap) aggregation of natural amyloidosenic proteins or peptides when contacted with a molar excess amount of natural beta-Aps relative to the modulator. This sequence represents a fragment of the long form of beta-amyloid used in the creation of an amyloid modulator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amyloid modulator compound useful for treatment of an amyloidogenic disease such as Alzheimer's disease comprises an aggregation core domain and a modifying group attached to it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Beta amyloid peptide; beta-AP; beta amyloid precursor protein; A-beta; APP-770; amyloid aggregation; amyloidogenic; Alzheimer's disease; noctropic; neuroprotective; immunosuppressive; antimicrobial; auditory; amtidiabetic; antipyretic; dermatological; cardiovascular; nephrotropic; amyloid aggregation inhibitor; neurotoxicity inhibitor; Down's syndrome; amyloidogenic disease; beta amyloid deposition; amyloidosis; hereditary cerebral haemorrhage; familial amyloid polyneuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

             (beta-AP). (1) are used in the manufacture of a medicament for the diagnosis or treatment of an amyloidogenic disease e.g. Alzheimer's disease and other clinical occurrences of beta amyloid deposition such as Down's syndrome individuals and in patients with hereditary cerebral haemorrhage with amyloidosis, and for treating a disorder associated with amyloidosis such as familial amyloid polymeuropathy. (1) reduces the toxicity of natural beta-AP aggregates to cultured neuronal cells. (1) not only reduces the formation of neurotoxic aggregates but also have the ability to reduce the neurotoxicity of performed A-beta fibrils. The present sequence represents a beta-AP peptide, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral haemorrhage with amyloidosis of the Dutch type and haemorrhagic stroke. The present sequence represents one of a group of peptides (Adul1648-AAU11810 & AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40 inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Amyloid-beta40 inhibitor; Abeta40 inhibitor; cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide #24, used as carrier for the amyloid-beta40 (Abeta40) inhibitor.
 nhibitor and a neurotoxicity inhibitor of natural beta amyloid peptide
                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                   Length 6;
                                                                                                                                                                                                                                                                                                                      Indels

The invention is used for treating disorder associated with amyloidosis, particularly familial amyloid polyneuropathy (Portuguese, Japanese and Swelish types), familial amyloid.cardiomyopathy (Danish type), isolated cardiac amyloid, systemic senile amyloidosis, gerapie, bovine spongiform encephalopathy, Creutzfeldt-Jakob disease, Gerstman-Straussler-Scheinker syndrome, adult onset diabetes, insulinoma, isolated atrial amyloidosis, idiopathic (primary)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               hereditary cerebral haemorrhage; haemodialysis; thyroid;
renal amyloidosis; lysozyme-associated hereditary systemic amyloidosis;
beta-amyloid peptide; human.
                                                                                                                 Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New amyloidogenic protein aggregation modulators useful for treating disorder associated with amyloidosis e.g. familial amyloid polyneuropathy, Creutzfeldt-Jakob disease and adult onset diabetes.
                                                                                                                                                                                                                                                                                                                                                                                             Amyloidogenic protein; therapy; amyloidosis; familial amyloid polyneuropathy; cardiomyopathy; systemic senile amyloidosis; bovine spongiform encephalopathy; systemic senile amyloidosis; bovine spongiform encephalopathy; Creutzfeldt-Jakob disease; destimant-Straussler-Scheinker syndrome; diabetes; insulinoma; myeloma; Sjogren's syndrome; familial mediterranean fever; urticaria; deafness;
was used in the invention to treat a disease state characterised by

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidemimetic that modulates amyloid-beta fibril formation, or therapeutic immune response against amyloid-beta fibril formation; or therapeutic immune system modulator that prevents or inhibits amyloid-beta fibril formation; or (ii) an immune system modulator that prevents or inhibits amyloid-beta for intriparchia anticonvulsant, anticaptorective, heamostatic, copthalmological, antithyroid, wasotropic, cardiovascular, tranquilliser, uropathic, anticonvulsant, anticaptions and indocrate and hypnotic activities, and be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an enrolate a graphical cardiard, anticaption and all propersions and hypnotic activities, and any operator of familial (breditary) in all cognitive impairment, mild-to-moderate cognitive impairment, vascular dementia, corebrate, including hypothyroidism, erebroal near related macular complexed anglospath, hereditary cerebral haemorrhage, semile dementia, nown's syndrome, inclusion body myositis, age-related macular cheases, amyotrophic lateral sclerosis, acquired immunodeficiency, ageression, or a condition associated with Alzahimer's disease, candiovascular disease, amyotrophic lateral sclerosis, acquired immunodeficiency, ageression, or incontinence), a neurological condition (e.g. Huntington's disease, amyotrophic lateral sclerosis, acquired immunodeficiency, syncope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural cattack incoordination, galt disturbance, transient ischaement, and anyloid deficits, incoordination, sexual disorder, weight loss, percenting anyloid precursor protein gene, an Apos gene, or a psychological condition (e.g. huntan having a genomic mitation in an amyloid precursor protein gene, an Apos gene, or a presentle an amyloid brecursor protein ge
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       amyloid-beta; amyloid-beta related disease;

The present invention describes compositions (C) comprising: (a) a first capent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that a second agent (a2) that is: (ii) a peptide or peptidomimetic that condulates amyloid-beta fibril formation, or contropic, meuroprotective, carebroprotective, heemostatic, CO phtahemological, antithyroid, vasotropic, cardioant, mencular, natidepressant, antithyroid, vasotropic, cardioant, mecular, antichproid, vasotropic, cardioant, mecular, cardial, antichproid, vasotropic, cardioant, mecular, cardial, antichproid, vasotropic, cardioant, mecular, antichproid, vasotropic, cardioant, mecular, antichproid, vasotropic, cardial, antichproid, vasotropic, cardial, cardial, antichproid, vasotropic, cardial, or familial (hereditary)), mid comitators, condidators, condidators, cold cand can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an immune system modulators, cold candidated and hypotropical condition associated with Alzahemer's disease (modulators) and condition associated with Alzahemer's disease (including hypothyroidism, creebral hemorrhage, senile dementia, on the continence) and neurological condition (e.g. huntington) and spathy, aggression, or incontinence) an neurological condition (e.g. huntington) and the leaves, seniory loss, visual catack, recondination, gait disturbance, transient ischaemic altered maced to appropriate and papala, appraisable appraisable appraisable and the candidate and the can be used as anticition, exaul disorder, weight loss, your candidation, sexual disorder, weight loss, papala, an entition of the present sequence behavioural dysfunction; neurological condition; psychological condition; Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator. Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.

Disclosure; Page 87; 143pp; English.

a second agent (a1) that prevents or treats amyloid-beta related disease, and (b)
a second agent (a2) that is: (i) a peptide or peptidomimetic that
condidates amyloid-beta fibril formation or induces a prophylactic or
therapeutic immune response against amyloid-beta fibril formation; or
(ii) an immune system modulator that prevents or inhibits amyloid-beta
(ii) an immune system modulator that prevents or inhibits amyloid-beta
(iii) an immune system modulator that prevents or inhibits amyloid-beta
notropic, neuroprotective, cerebroprotective, haemostatic,
coptablic, antichyroid, vasotropic, cardiovascular, tranquilliser,
uropathic, antichyroid, vasotropic, cardiovascular,
antichyroid, asotropic, cardiovascular,
antichyroid, asotropic, cardiovascular,
antichyroid, asotropic, cardiovascular,
antichyroid, santichyroid, vasotropic, and as
immune system modulators. (C) can be used for preventing or treating an
immune system modulators. (C) can be used for preventing or treating an
amyloid-beta related disease e.g. Alzheimer's disease (including sporadic
conhereditary) or familial (hereditary)), mild cognitive impairment,
mild-to-moderate cognitive impairment, vascular dementia, cerebral
amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, present invention describes compositions (C) comprising: (a) a first

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that a second agent (a2) that is: (i) a peptide or peptidomimetic that a second agent (a2) that is: (i) a peptide or peptidomimetic that conditions amyloid-beta fibril formation, or therapeutic immune response against amyloid-beta inhibite amyloid-beta fibril formation. Or induces a prophylactic or that prevents or inhibite amyloid-beta fibril formation. Also described is a kit comprising (C): (C) have noothed, anticonvulant, anticonvulant, miscondiant, anticonvulant or conditions amyloid-beta fibril formation modulators, and a myloid-beta related disease e.g. Alzabimer's disease (including sporadic of mon-brediatry) or familial (hreddiatry), mild cognitive impairment, mild-to-moderate cognitive impairment, vascular dementia, cerebral mayloid angiopathy, hereditary cerebral haemorrhage, senile dementia, cowniciding hypothyroidism, cerebral haemorrhage, senile dementia, cowniciding hypothyroidism, cerebral haemorrhage, senile dementia, cowniciding hypothyroidism, cerebral haemorrhage, senile dementia, disease, amovorrophic lateral sclerosis, acquired immunodeficiency, cardiant or incontinence), a neurological condition (e.g. apathy apartines, and deficits, incoordination, gardiant disease, amovorrophic lateral sclerosis, acquired immunodeficitus, cardiant deficits, incoordination, gardiant disease, amovorrophic lateral sclerosis, acquired immunodeficitus, cardiant deficits, incoordination, gardiant disease, amovorrophic lateral sclerosis, acquired immunodeficitus, cardiant deficitus, apraxia, agnosia, pot sensity disease, amovorrophic lateral deficitus, depressed mood, irritability, anhedonia, social withdrawal, or excessive gilly
                                                                                                                                                                          Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

ANW02310-W02332 represent the peptide portions of the beta-amyloid modulator compounds of the invention. Beta-amyloid peptide is a 4 k110dalton peptide that is the major protein component of anyloid plaques are present both in the brain lesions, and in the walls of cerebral blood vessels in Alzheimer's disease patients. The amyloid modulators of the invention comprise an amyloid caption and peptide (such as this sequence) coupled directly or indirectly to at least one modifying group. The modifying group is preferably a cyclic, heterocyclic, or polycyclic group, such as declain, a cholanyl group, a biotin containing group. The aggregation of these sequences to natural amyloid proteins or peptides when contacted with the natural amyloid proteins or peptides. The modulator compounds can be used in the trearment of disorders associated with amyloidosis, such as familial amyloid organic proteins or peptides. The modulator compounds can be used in the trearment of disorders associated with amyloidosis, such as isolated cardiac amyloidosis, systemic senile amyloidosis, scrapie, bovine spongiform encephalopathy, familial amyloidosis, scrapie, bovine spongiform encephalopathy. Creutzfeldt-Jakob disease, adult-onset diabetes, insulinoma, familial Mediterranean fever, familial amyloid compensor and other types of amyloidosis. The modulators are also useful for the trearment of disorders associated with beta-amyloidosis, especially
                                                                                                                                                                                                                                                     k MB, Gefter ML, Hundal A;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           forms of amyloid precursor proteins comprising from the 5' to the 3' end as gequence encoding a marker and either (1) a sequence encoding the Nuterial and a sequence encoding the Nuterial (APP) up to, but not including the nucleotides encoding the beta amyloid protein (BAP) up to, but not including the nucleotides encoding the beta amyloid protein (BAP) domain or (2) the BAP domain; or the two ligated together, can be used to detect drugs or compounds that inhibit/augment the activity of proteolytic enzymes which cleave APP to generate BAP fragments (deposition of which occurs in patients with Alzheimers disease and Down's syndrome). This fragment corresponding to amino acid residues 14-20 of BAP can be altered and affect the level of secretion of APP's containing the BAP sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New mutant forms of amyloid precursor protein - for detecting opds. that modify activity of enzymes involved in precursor cleavage, also new
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Beta-amyloid; modulator; amyloid plaque; brain lesion; amyloidosis; cerebral blood vessel; Alzheimer's disease; amyloidogenic protein; familial amyloid polyneuropathy; familial amyloid cardiomyopathy; isolated cardiac amyloidosis; systemic senile amyloidosis; insulinoma; bovine spongiform encephalopathy; Creutrieldt-Jakob disease; urticaria, adult-onset diabetes; familial Mediterranean fever; therapy; deafness; scrapie; familial amyloid nephropathy; hereditary cerebral haemorrhage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant polypeptides produced using the coding sequences of mutant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    modulator compounds of the invention. Beta-amyloid peptide is a 4

Kilodalton peptide that is the major protein component of amyloid

plaques. Amyloid plaques are present both in the brain leaions, and in

the walls of cerebral blood vessels in Alzheimer's disease patients. The

amyloid modulators of the invention comprise an amyloid openic protein or

peptide (such as this sequence) coupled directly or indirectly to at

least one modifying group. The modifying group is preferably a cyclic,

heterocyclic, or polycyclic group, such as declain, a cholamyl group, a

botin containing group, or a fluorescein containing group. These

compounds then modulate the aggregation of these sequences to natural

amyloid proteins or peptides when conteacted with the natural

amyloid proteins or peptides. The modulator compounds can be used

in the treatment of disorders associated with the natural

compounds amyloidogis, systemic senile amyloidosis, such as

familial amyloid proteins encephalopathy, familial amyloid disease, adult-onset

diabetes, insulinoma, familial Mediterranean fever, familial amyloid

chabetes, insulinoma, familial Mediterranean fever, familial amyloid

and other types of amyloidosis. The modulators are also useful for the

creatment of disorders associated with beta-amyloidosis, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
```

```
This sequence represents a fragment of the amyloid beta peptide. The invention relates to the use of peptide compounds for inhibition of polymerisation of amyloid beta peptide (ABP), as model substances for polymerisation of amyloid beta peptide (ABP), as model substances for synthesis of ABP-ligands for inhibition of polymerisation of ABP, as a cool for the identification of other organic compounds with similar than properties, or as ligands in positron emission tomography. The peptides may be used in treatment of amyloidosis, epetially in treatment of prevention of demens in patients with amyloidosis, for treatment or prevention of hereditary cerebral haemorrhage with amyloidosis (Dutch Cype) or for the prevention of fibril formation of human amyloid protein. They can also be used for identifying other molecules with similar properties and/or as ligands for detection of amyloid deposits using e.g. follow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; beta-amyloid peptide; Alzheimer's disease; amyloidogenic protein; aggregation; neurotoxicity; amyloidosis; Down's syndrome; cardiomyopathy; familial amyloid polymeuropathy; bovine spongiform encephalopathy; Creutzfeldt-Jakob disease; bAP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                  The present invention describes beta-amyloid peptide (bAP) derivatives. The bAP derivatives inhibit aggregation of amyloidogenic proteins and peptides, specifically bAP, and their neurotoxicity, so are useful for treating and preventing any disease involving amyloidosis, specifically Alzheimer's disease but also Down's syndrome, familial amyloid polyneuropathy or cardiomyopathy, bovine spongiform encephalopathy and creutzfeldt-Jakob disease. The bAP derivatives are also used to diagnose these diseases, in vitro or in vivo, by detecting binding of bAP to labelled bAP derivatives. Some bAP derivatives inhibit bAP aggregation even when bAP is present in molar excess. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; beta-amyloid peptide; Alzheimer's disease; amyloidogenic protein; aggregation; neurotoxicity; amyloidosis; Down's syndrome; cardiomyopathy; familial amyloid polyneuropathy; bovine spongiform encephalopathy; Creutzfeldt-Jakob disease; bby

                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes beta-amyloid peptide (bAP) derivatives. The bAP derivatives inhibit aggregation of amyloidogenic proteins and peptides, specifically bAP, and their neurotoxicity, so are useful for treating and preventing any disease involving amyloidosis, specifically Alzheimer's disease but also Down's syndrome, familial amyloid polyneuropathy or cardiomyopathy, bovine spongiform encephalopathy and Creuzzfeldt-Jakob disease. The bAP derivatives are also used to diagnose these diseases, in vitro or in vivo, by detecting binding of bAP to labelled bAP derivatives. Some bAP derivatives inhibit bAP aggregation even when bAP is present in molar excess. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Beta-amyloid, amyloid modulator; amyloidogenic protein; amyloidosis; familial amyloid cardiomyopathy; familial amyloid cardiomyopathy; isolated cardiac amyloid, systemic senile amyloidosis; scrapie; myeloma; bovine spongiform encephalopathy; BSE; Creutzfeldt-Jakob dieease; adult onset diabetes; Gerstmann-Straussler-Scheinker syndrome; insulinoma; atrial amyloidosis; idiopathic amyloidosis; haemodialysis; macroglobulinaemia-associated amyloidosis; reactive amyloidosis; primary localised cutaneous nodular amyloidosis; Sjogren's syndrome; hereditary cerebral haemorrhage with amyloidosis; Muckle-Wells syndrome;
                                                                                                                                                                                                              New peptide(s) derived from beta-amyloid peptide that inhibit amyloid aggregation - and neurotoxicity, specifically for treatment and prevention of Alzheimer's disease.

The invention describes an amyloid modulator comprising an amyloidogenic protein and/or peptide fragment coupled to a modifying group so that the compound modulates the aggregation of natural amyloid proteins or peptides. The modulator is used for treating a disorder associated with amyloidosis e.g. familial amyloid cardiomyopathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Portuguese, Japanese congulated amyloid cardiomyopathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Portuguese, Japanese and familial amyloidosis, idiopathic (primary) amyloidosis, acrapie, bovine spongiform encephalopathy. Creutzfeldt-Jakob disease, adult onset atrial amyloidosis, idiopathic (primary) amyloidosis, macroglobulinaemia-associated myloidosis, primary localised cutaneous condular amyloidosis familial Mediterranean Fever and familial amyloidosis associated with Siogren's syndrome, reactive (secondary) amyloidosis familial amyloidosis of Finnish type, amyloidosis of Icelandic type, emyloidosis associated with long term haemofiallysis, hereditary ill), familial amyloidosis of the thyroid, fibrinogen-associated with compound is capable of altering and inhibiting betamyloidosis. The compound is capable of altering and inhibiting betamyloid protein (beta-AP) aggregation of natural amyloidosis associated when contacted with a molar excess amount of natural beta-APs crelative to the modulator. This sequence represents a fragment of the crelator of natural beta-APs long form of beta-amyloid used in the creation of an amyloid modulator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                              Amyloid modulator useful for treating a disorder associated with amyloidosis, comprises an amyloidogenic protein and/or a peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Beta-amyloid; amyloid modulator; amyloidogenic protein; amyloidosis; familial amyloid polyneuropathy; familial amyloid cardiac amyloid; systemic senile amyloid cardiac amyloid; systemic senile amyloidosis; scrapie; myeloma; bovine spongiform encephalopathy; BSE; Creutzfeldt-Jakob disease; adult onset diabetes; Gerstmann-Straussler-Scheinker syndrome; haemodial amyloidosis; haemodialysis; macroglobulinaemia-associated amyloidosis; reactive amyloidosis; primary localised cutaneous nodular amyloidosis; Sjogren's syndrome; hereditary oerebral haemorrhage with amyloidosis; Muckle-Wells syndrome; familial Mediterranean Fever.

The invention describes an amyloid modulator comprising an amyloidogenic protein and/or peptide fragment coupled to a modifying group so that the compound modulates the aggregation of natural amyloid proteins or peptides. The modulator is used for treating a disorder associated with compound modulator is used for treating a disorder associated with amyloidosis e.g. familial amyloid polyneuropathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Danish type), isolated cardiac amyloid systemic senile amyloidosis, scrapie, bovine spongiform encephalopathy. Creutzfeld.—Jakob disease, adult onset diabetes, Gerstmann-Straussler-Scheinker syndrome, insulinoma, isolated artial amyloidosis, primary localised cutaneous cartial amyloidosis, familial Mediterranean Fever and familial carpoid nephropathy with urticaria and deafness (Muckle-Wells syndrome), hereditary cerebral haemorrhage with amyloidosis of Icelandic type, camyloid nephropathy with urticaria and deafness (Muckle-Wells syndrome), hereditary cerebral haemorrhage with amyloidosis of Icelandic type, camyloidosis associated with long term haemodialaysis, hereditary non-neuropathic systemic amyloidosis (familial amyloidosis associated hereditary systemic camyloidosis of the thyroid, fibrinogen-associated hereditary carcinoma of protein (beta-AP) aggregation of natural amyloidosis amyloid protein (beta-AP) aggregation of natural amyloidosis when contacted with a molar excess amount of natural beta-APs crelative to the modulator. This sequence represents a fragment of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                    Amyloid modulator useful for treating a disorder associated with amyloidosis, comprises an amyloidogenic protein and/or a peptide fragment coupled to a modifying group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Beta amyloid peptide; beta-AP; beta amyloid precursor protein; A-beta; APP-770; amyloid aggregation; amyloidogenic; Alzheimer's disease; nootropic; neuroprotective; immunosuppressive; antimicrobial; auditory;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gapa

comprising an aggregation core domain and a modifying group attached to it. [1] has nootropic, neuroprotective, immunosuppressive, antimicrobial, antidiabetic, antipyretic, dermatological, cardiovascular, nephrotropic, and auditory activities, and can be used as a natural amyloid aggregation inhibitor and a neurotoxicity inhibitor of natural beta amyloid aggregation (beta-APP). [1] are used in the manufacture of a medicament for the diagnosis or treatment of an amyloidogenic disease e.g. Alzheimer's disease and other clinical occurrences of beta amyloid deposition such as common and anyloidosis, and in patients with hereafitary cerebral heamorrhage with amyloidosis, and for treating a disorder associated with amyloidosis such as familial amyloid polymeuropathy. [1] reduces the coxicity of natural beta-AP aggregates to cultured neuronal cells. [1] not only reduces the formation of neurotoxic aggregates but also have the ability to reduce the neurotoxicity of performed A-beta fibrils. The present sequence is beta-AP peptide, which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amyloid modulator compound useful for treatment of an amyloidogenic disease such as Alzheimer's disease comprises an aggregation core domain and a modifying group attached to it.
antidiabetic; antipyretic; dermatological; cardiovascular; nephrotropic; amyloid aggregation inhibitor; neurotoxicity inhibitor; Down's syndrome; amyloidogenic disease; beta amyloid deposition; amyloidosis; hereditary cerebral haemorrhage; familial amyloid polyneuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antibody molecule; antibody; beta-A4 peptide; Abeta4; neuroprotective; nootropic; antiparkinsonian; gene therapy; amyloidogenesis; amyloid-plaque formation; beta-amyloid plaque; immunisation; dementia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present invention describes an amyloid modulator compound (I)

Solid-phase synthesis heptapeptide #13.

(first entry)

20-NOV-2003

ADA90936 standard; peptide; 7 AA.

```
The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Gilu-Phe-Arg-His-Asp-CS-Ger-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence val-His-His-Gilu-Iys-Leu-Val-Phe-Phe-Ala-Gilu-App-Val-Gily ADA89886 or its fragment. Also described: (I) a mucleic acid molecule canced in a mucleic acid molecule canced molecule canced molecule canced molecule canced for (I); (2) a vector comprising the nucleic acid of (I); (3) a host call of (3) under conditions that allow synthesis of culturing the host call of (3) under conditions that allow synthesis of culturing the host call of (3) under conditions that allow synthesis of culturing the host call of (3) under conditions that allow synthesis of culturing the host call of (3) under conditions that allow synthesis of (I); (8) testing the reculting fab optimisation library by panning or nucleic acid of (I), vector of (2) or host call of (3); (7) optimising of composition, comprising optimisation of (I), and formulating the composition, composition prepared by method (8): (1) has a carier; and (12) a paramaceutical composition prepared by method (8): (1) has canced on the prevention and/or treatment of a disease associated with antibody molecule with a carrier; and call molecule composition for the prevention and/or treatment of a disease associated with antibody molecule of the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease is captacted formation. In particular, the disease mentioned above. The antibody is used for the disease is captacted dementia, Alzheimer's disease, hereditary cerebral hamoral disease is created by an event in particular, the disease mentioned above. The antibody is used for the disease is created by an event of the disease, motor neuropathy, bown's syndrome, compo
Alzheimer's disease; motor neuropathy; Down's syndrome;

The present invention describes an antibody molecule (1) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The specifically recognising two regions of the beta-A4 peptide/Abeta4. The specifically recognising two regions of the second region comprises the amino acid sequence Ala-Glu-Phe-Asp-CC first region comprises the amino acid sequence Val-His-Glu-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly Abassas or its fragment, Also described: (1) a mucleic acid molecule coroding (1); (2) a vector comprising the nucleic acid of (1); (3) a host coll comprising the vector (2); (3) under conditions that allow synthesis of colluring the host cell of (3) under conditions that allow synthesis of culturing the host cell of (3) under conditions that allow synthesis of colluring the host cell of (3) under conditions that allow synthesis of colluring the resulting Fab optimisation (4); (6) a kit comprising (1) or an antibody molecule produced by method (4); (6) a kit comprising (1) conditions that allow synthesis of (1); (8) testing the resulting Fab optimisation library by panning against Abeta/Abeta4; (9) identifying optimised clones; (10) expressing of selected, optimised clones; (11) preparing a pharmaceutical composition prepared by method (8). (1) has comprised antibody/antibody molecule with a carrier; and (12) a pharmaceutical composition prepared by method (8). (1) has contropic and antiparkinsonian activities, and can be neuroprotective, nootropic and antiparkinsonian activities, and can be used in gene therapy. The antibody molecule (1), nucleic acid molecule contropic and antiparkinsonian activities, and can be used in gene therapy. The antibody molecule (1), nucleic acid with amyloidogenesis and/or amyloid-plaque formation. The antibody is used for the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease mentioned placed formation in particular, the prevention of beta-amyloid pl

                                                                                   The invention relates to amyloidogenic proteins or peptide fragments asgregation modulators. The invention is used for treating disorder associated with amyloidosts, particularly familial amyloid polyneuropathy (Portuguese, Japanese and Swedish types), familial amyloid acadiomyopathy (Danish type), isolated cardiac amyloid, systemic senile amyloidosis, Garapie, bovine spondiform encephalogathy, Creutzfeldt-Jakob disease, Gerstmann-Straussler-Scheinker syndrome, adult onset diabetes, insulinoma, isolated atrial amyloidosis, idiopathic (primary) localized cutaneous nodular amyloidosis, idiopathic (primary) localized cutaneous nodular amyloidosis, associated amyloidosis, primary localized cutaneous nodular amyloidosis, familial Mediterranean Fever and familial amyloid nephropathy with urticaria and deafness (Muckle-
                                                                                                                                                                                                                                                                                                                                                             Wells syndrome), hereditary cerebral haemorrhage with amyloidosis of Icelandic type, amyloidosis associated with long term haemodialysis, hereditary non-neuropathic systemic amyloidosis (familial amyloid polyneuropathy III), familial amyloidosis of finnish type, amyloidosis associated with medullary carcinoma of the thyroid, fibrinogen associated medulary carcinoma of the thyroid, fibrinogen associated mayloidosis and lysozyme-associated hereditary systemic amyloidosis. The present sequence is beta-amyloid peptide fragment used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cerebrovascular disease, cardiovascular disease, memory loss, anxiety, behavioural dysfunction, neurological condition; psychological condition, vaccine antigen.

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that medialate amyloid-beta fibril formation, or therapeutic immune response against amyloid-beta is itshil formation, or (ii) an immune system modulator that prevents or inhibits amyloid-beta (ii) an immune system modulator that prevents or inhibits amyloid-beta (ii) an immune system modulator that prevents or inhibits amyloid-beta (iii) an introorvulaant, antichary anticharkinsonian, muscular, tranquilliser, uropathic, anticonvulaant, antichary anticharkinsonian, muscular, cortivities, or and can be used as amyloid-beta fibril formation modulators, and as immune system modulators (C) can be used for sesse e.g. Alzheimer's disease (including sporadic much exeditary) or familial (hereditary), mild cognitive impairment, mild-to-moderate cognitive impairment, vascular dementia, cerebral manilal dementia, cerebral modulators, including hypothyrolidism, exeboroascular disease, cardiovascular dementia, cerebral compassion, or a condition associated with Alzheimer's disease (including hypothyrolidism, exeboroascular disease, cardiovascular disease, memory loss, anxiety, a behavioural dystunction (e.g. apathy, alsease, memory loss, anxiety, a behavioural dystunction (e.g. muthing anyotrophic lateral sclerosis acquired immunodeficiency, parkinson's disease, aphasia, apraxia, agnosia, pick disease, dementia (ield deficits, incoordination, gait disturbance, transient ischemoic stransient ischemoic stransient schemon, brain tumour, posttraumatic brain injury, or posthypoxic damage), or a psychological condition (e.g. depression, depressed mood, irritability, annedminal deficit, frequent discinding sporacy or excessive quilt)) in a subject e.g. human having a genomic mutation in an auting amyloid-beta deposited which is used in the exemplification of the
                                                                                                                    Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that modulates amyloid-beta fibril formation; or (therapeutic immune response against amyloid-beta fibril formation; or (ii) an immune system modulator that prevents or inhibits amyloid-beta fibril formation; or (iii) an immune system modulator that prevents or inhibits amyloid-beta (ibril formation. Also described is a kit comprising (C). (C) have notropic, neuroprofective, cerebroprofective, haemostatic. (C) have notropic, neuroprofective, cerebroprofective, haemostatic. coptibility antichyroid, vasotropic, cardiovascular, tranquilliser, uropathic, auticonvulsant, anti-HIV, antiparkinsonian, muscular, trandquilliser, uropathic, auticonvulsant, anti-HIV, antiparkinsonian, muscular, uropathic, auticonvulsant, anti-HIV, mild cognitive impairment, vasotlar dementia, care cognitive impairment, vasotlar dementia, care amyloid-beta related disease e.g. Alzheimer, vasotlar dementia, amild-to-moderate cognitive impairment, vasotlar dementia, cample amyloid angiopathy, hereditary cerebral haemorrhage, senile dementia, amyloid angiopathy, hereditary cerebral haemorrhage, cardiovascular (including hypothyroidism, cerebrovascular disease, cardiovascular disease, amycrophic lateral selerosis, acquired immunodeficiency, appression, or incontinence), a neurological condition (e.g. apathy, aggression, or incontinence), an eurological condition (e.g. senatory or posthypoxic cuttack or stroke, transisent alerted muscle tone, seluraes, senator, or apsychological condition (e.g. depression, delusation, ballucination, sexual disorder, weight loss, psychological condition (e.g. depression, delusation, sexual disorder, weight or excessive
                                                                                                                                                                                                                                                                         cerebrovascular disease, cardiovascular disease, memory loss, anxiety, behavioural dysfunction; neurological condition; psychological condition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
amyloid-beta fibril formation; immune response; nootropic; neuropictective; cerebroprotective; haemostatic; ophthalmological; antithyroid; vasotropic; cardiovascular; ranquilliser; uropathic; anticonvulsant; anti-HTV; antiparkinsonian; muscular; neuroleptic; cardiant; antidepressant; endocrine; hypnotic; amyloid-beta fibril formation modulacor; immune system modulator; Alzhaimer's disease; mild cognitive impairment; mild-to-moderate cognitive impairment; vascular dementia; ererbral amyloid angiopathy; hereditary cerebral heemorrhage; senile dementia; bown's syndrome; inclusion body myositis; age-related macular degeneration; hypothyroidism;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; Page 87; 143pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes compositions (C) comprising: (a) a first agent (al) that prevents or treats amyloid-beta related disease; and (b) as ascond agent (al) that is: (i) a peptide or peptidomimetic that modulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation; or therapeutic immune system modulator that prevents or inhibits amyloid-beta fibril formation; or fibril formation is a kit comprising (C). (C) have nootropic, neuroprotective, cerebroprotective, haemostatic, ophthalmological, antithyroid, vasotropic, cardiovascular, tranquilliser,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
having amyloid-beta deposits. The present sequence represents a beta-
amyloid modulator peptide which is used in the exemplification of the
present invention.

Anwighton peptide that is the major protons of the beca-amyloid and addition compounds of the invention. Beta-amyloid peptide is a kilodalton peptide that is the major protein component of amyloid plaques are present both in the brain lesions, and in plaques. Amyloid plaques are present both in the brain lesions, and in the amyloid modulators of the invention comprise an amyloidogenic protein or peptide (such as this sequence) coupled directly or indirectly to at least one modifying group. The modifying group is preferably a cyclic, heterocyclic, or polycyclic group, such as declain, a cholanyl group, a biotin containing group. The modifying group is preferably a cyclic, compounds then modulate the aggregation of these sequences to natural amyloid proteins or peptides when contacted with the natural amyloid proteins or peptides. The modulator compounds can be used in the treatment of disorders associated with amyloidosis, such as familial amyloid cardiac amyloidosis, systemic senile amyloidosis, sorapie, to bovine spongiform encephalopathy, Creutzfeldt-Jakob disease, adult-onset of disorders associated with amyloidosis, sorapie, sorapie, septent especially myloid and other types of amyloidosis. The modulators are also useful for the struction of disorders associated with beta-amyloidosis, especially in the contaction of the modulators are also useful for the struction of disorders associated with beta-amyloidosis, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                           셤
                                                                                                              This sequence represents a fragment of the amyloid beta peptide. The invention relates to the use of peptide compounds for inhibition of anyloid beta peptide (ABP), as model substances for synthesis of ABP-ligands for inhibition of polymerisation of ABP, as a colymerisation of ABP, as a tool for the identification of other organic compounds with similar tool functional properties, or as ligands in positron emission tomography. The peptides may be used in treatment of amyloidosis, especially in treatment or pervention of demens in patients with amyloidosis, for treatment or prevention of demens in patients with bown's syndrome, for treatment or prevention of hereditary cerebral haemorrhage with amyloidosis (Dutch type) or for the prevention of fibril formation of human amyloid protein. They can also be used for identifying other molecules with similar properties and/or as ligands for detection of amyloid deposits using e.g. positron emission tomography. The bAP derivatives inhibit aggregation of amyloidogenic proteins and peptides, specifically bAP, and their neurotoxicity, so are useful for treating and preventing any disease involving amyloidosis, specifically Alzheimer's disease but also Down's syndrome, familial amyloid polyneuropathy or cardiomyopathy, bovine spongiform encephalopathy and preventing and derivatives are also used to diagnose these diseases, in vitro or in vivo, by detecting binding of bAP to labelled bAP derivatives. Some bAP derivatives inhibit bAP aggregation even when bAP is present in molar excess. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amyloid modulator useful for treating a disorder associated with amyloidosis, comprises an amyloidogenic protein and/or a peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Beta-amyloid, amyloid modulator; amyloidogenic protein; amyloidosis; isolated amyloid polymeuropathy; familial amyloid cardiomyopathy; isolated cardiac amyloid, systemic senile amyloidosis; scrapie; myeloma; bovine spongiform encephalopathy; BSE; Creutzfeldt-Jakob disease; adult onset diabetes; Gerstmann-Straussler-Scheinker syndrome; insulinoma; arrial amyloidosis; idiopathic amyloidosis; haemodialysis; macroglobulinaemia-associated amyloidosis; reactive amyloidosis; primary localised cutaneous nodular amyloidosis; Sjogren's syndrome; hereditary non-neuropathic systemic amyloidosis; Muckle-Wells syndrome; familial Mediterranean Pever.
New peptide(8) derived from beta-amyloid peptide that inhibit amyloid aggregation - and neurofoxicity, specifically for treatment and prevention of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The invention describes an amyloid modulator comprising an amyloidogenic protein and/or peptide fragment coupled to a modifying group so that the protein and/or peptide fragment coupled to a modifying group so that the compound modulates the aggregation of natural amyloid proteins or peptides. The modulator is used for treating a disorder associated with amyloidosis e.g. familial amyloid cardiomyopathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Danish type), composition encephalopathy, Creutzfeldt-Jākob disease, adult onset diabetes, Gerstmann-Straussler-Scheinker syndrome, insulinoma, isolated artial amyloidosis, indiopathic (primary) amyloidosis, scrapie, bovine compular amyloidosis, familial Mediterranean Fever and familial amyloid nephropathy with urticaria and deafness (Muckle-Wells syndrome), hereditary cerebral haemorrhage with amyloidosis of Icalandic type, compulation nephropathy with urticaria and deafness (Muckle-Wells syndrome), hereditary cerebral haemorrhage with amyloidosis of Icalandic type, amyloidosis associated with long term haemodialysis, hereditary non-neuropathic systemic amyloidosis of the thyroid, fibringen-associated with III), camyloidosis of the thyroid, fibringen-associated with amyloidosis associated hereditary systemic amyloidosis and lysozyme-associated hereditary systemic compound is capable of altering and inhibiting beta-App aggregation of an amyloidosis and preprides when contacted with a molar excess amount of natural beta-App creative to the modulator. This sequence represents a fragment of the corporation of an amyloid modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Beta amyloid peptide; beta-AP; beta amyloid precursor protein; A-beta; APP-770; amyloid aggregation; amyloidogenic; Alzheimer's disease; nootropic; neuroprotective; immunosuppressive; antimicrobial; auditory; amtidiabetic; antipyretic; dermatological; cardiovascular; nephrotropic; amyloid aggregation inhibitor; neurotoxicity inhibitor; Down's syndrome; amyloidogenic disease; beta amyloid deposition; amyloidosis; hereditary cerebral haemorrhage; familial amyloid polyneuropathy.

The present invention describes an amyloid modulator compound (I) comprising an aggregation core domain and a modifying group attached to it. (I) has noctropic, neuroprotective, immunosuppressive, antimicrobial, antidiabetic, antipyretic, dermatological, cardiovascular, nephrotropic and auditory activities, and can be used as a natural amyloid aggregation inhibitor and a neurotoxicity inhibitor of natural beta amyloid aggregation (beta-Ap). (I) are used in the manufacture of a medicament for the diagnosis or treatment of an amyloidogenic disease e.g. Alzhaimer's disease and other clinical occurrences of beta amyloid deposition such as Down's syndrome individuals and in patients with hereditary cerebral
                                                                                                                                                                                                                                                                                                                                                                                                   haemorrhage with amyloidosis, and for treating a disorder associated with amyloidosis such as familial amyloid polyneuropathy. (1) reduces the toxicity of natural beta-AP aggregates to cultured neuronal calls. (1) not only reduces the formation of neurotoxic aggregates but also have the ability to reduce the neurotoxicity of performed A-beta fibrils. The present sequence represents a beta-AP peptide, which is used in the
                                                                                                  Amyloid modulator compound useful for treatment of an amyloidogenic disease such as Alzheimer's disease comprises an aggregation core domain and a modifying group attached to it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amyloidogenic protein; therapy; amyloidosis; familial amyloid polyneuropathy; cardiomyopathy; surdiomyopathy; surdiomyopathy; cardiomyopathy; cardiomyopathy; cardiomyopathy; cardiomyopathy; creutzfeldt-Jakob disease; derstmann-Straussler-Scheinker syndrome; diabetes; hsulinoma; myeloma; Sjogren's syndrome; familial mediterranean fever; urticaria; deafiness; hereitary cerebral haemorrhage; haemodialysis; thyroid; renal amyloidosis; lysozyme-associated hereditary systemic amyloidosis; beta-amyloid peptide; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                         The invention relates to amyloidogenic proteins or peptide fragments asgregation modulators. The invention is used for treating disorder associated with amyloidosis, particularly familial amyloid polyneuropathy (Portuguese, Japanese and Swedish types), familial amyloid dolyneuropathy (Danish type), isolated cardiac amyloid, systemic senile amyloidosis, serapie, bovine spongiform encephalogathy, Creutzfeldt-Jakob disease, Gerstmann-Straussler-Scheinker syndrome, adult onset diabetes, insulinoma, isolated atrial amyloidosis, idiopathic (primary) amyloidosis, myeloma or macroglobulinemia-associated amyloidosis, primary localized cutaneous nodular amyloidosis, sassociated myloidosis, primary localized cutaneous nodular amyloidosis associated with Sjogren's syndrome, reactive (secondary) amyloidosis, familial Mediterranean Fever and familial amyloid nephropathy with urticaria and deafness (Muckie-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Wells syndrome), hereditary cerebral hamorrhage with amyloidosis of Icelandic type, amyloidosis associated with long term hamodialysis, hereditary non-neuropathic systemic amyloidosis (familal amyloid polyneuropathy III), familial amyloidosis of Finnish type, amyloidosis associated with medullary carcinoma of the thyroid, fibrinogen associated medulary carcinoma of the thyroid, fibrinogen associated mayloidosis and lysozyme-associated hereditary systemic amyloidosis. The present sequence is beta-amyloid peptide fragment used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     age-related macular degeneration; hypothyroidism;
cerebrovascular disease; cardiovascular disease; memory loss; anxiety;
behavioural dysfunction; neurological condition; psychological condition;
                                                                                                                                                                                                     New amyloidogenic protein aggregation modulators useful for treating disorder associated with amyloidosis e.g. familial amyloid polyneuropathy, Creutzfeldt-Jakob disease and adult onset diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        amyloid-beta; amyloid-beta related disease; amyloid-beta fibril formation; immune response; nootropic; neuroprotective; cerebroprotective; haemostatic; ophthalmological; antithyroid; vasotropic; cardiovascular; tranquilliser; uropathic; antithyroid; antitonvulsant; anti-HIV; antiparkinsonian; muscular; neuroleptic; cardiant; antidepressant; endocrine; hypnotic; amyloid-beta fibril formation modulator; immune system modulator; Alzheimer's disease; mild cognitive impairment; vascular dementia; cerebral amyloid angiopathy; hereditary cerebral haemorrhage; senile dementia; Down's syndrome; inclusion body myositis;

The present invention describes compositions (C) comprising: (a) a first capture (a1) that prevents or treats amyloid-beta related disease; and (b) agencial (a1) that prevents or treats amyloid-beta fibril formation or induces a prophylactic or therapeutic immune response against amyloid-beta appoint or induces a prophylactic or therapeutic immune response against amyloid-beta amyloid-beta fibril formation, or (ii) an immune system modulator that prevents or inhibits amyloid-beta for intripy or intripy (C). (C) have notropic, neuroprotective, c-rebroprotective, cardiovatic, or excitant, antidaporessant, endocrina, mencular, neurological, antithycoid, vasocropic, cardiovascular, tranquilliser, or pothalmological, antithycoid, vasocropic, cardiovascular, tranquilliser, or moderoptic, cardiant, antidaporessant, endocrina and hypnotic activities, neurologicis, cardiant, antidaporessant, endocrina and hypnotic activities, cand can be used as amyloid-beta fibril formation andylators, and anyloid-beta related disease (g. Alzheimer's disease (including sporadic non-bereditary) or familial (hereditary), mild cognitive impairment, mild-to-moderate cognitive impairment, vascular dementia, compreditary cerebral haemorrhage, senile dementia, Down's syndrome, inclusion body myositis, agencial condition (e.g. appthylosyloidism, cerebrowscular disease, cardiovascular disease, memory loss, anxiety, a behavioural dysfunction (e.g. appthylosyloidism, cerebras actives, assorbed the substance, and anyloid-beta ilteral alextness, actual disease, dementia stringes accompanies, and anyloid-beta interest actives, and anyloid-beta interest, and anyloid anyloidism, cardianton, gait disturbance, transient lateral disturbance, transient series, and anyloid precurse anyloid precurses and mood, irritiability, anhedomina, poor insulation, sexal disease, and present sequence represent successive gui
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.

The present invention describes compositions (C) comprising: (a) a first agent (al) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidominetic that condulates amyloid-beta fibril formation or induces a prophylactic or thereapeutic immune response against amyloid-beta fibril formation, or therapeutic immune response against amyloid-beta fibril formation, or therapeutic immune system modulator that prevents or inhibits amyloid-beta (ii) an immune system modulator that prevents or inhibits amyloid-beta contropic, neuroprotective, cerebroprotective, haemostatic, (C) have coptibing metriphycoid, vasotropic, cardiovascular, tranquilliser, corptable, anticonvulsant, anti-HIV, antiparkinsonian, muscular, corptable, cardiant, antidepressant, endocrine and hypnotic activities, and can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an emyloid-beta related disease e.g. Alzheimer's disease (including sporadic conn-hereditary) or familial (hereditary), mild cognitive impairment, cerebral mayloid angiopathy, hereditary cerebral haemorrhage, senile dementia, cageneration, or a condition associated with Alzheimer's disease (including hypothyroidism, cerebrovascular disease, cardiovascular disease, memory loss, anxiety, a behavioural disease, cardiovascular dementia aggression, or incontinence), a neurological condition (e.g. Muntington's disease, amyotrophic lateral sclerosis, acquired immunodeficiency, dementia
                                                                                                                                                                                                                     wayloid-beta; amyloid-beta related disease;

wayloid-beta fibril formation; immune response; nootropic;

wayloid-beta fibril formation; immune response; nootropic;

w neuroprotective; cerebroprotective; hemostatic; ophthalmological;

w neuroprotective; cardiovascular; tranquiliser; uropathic;

w antichyroid; vasotropic; cardiovascular; tranquiliser; uropathic;

w antichyroid; vasotropic; cardiovascular; muscular; neuroleptic;

w antichoryessant; endocrine; hypnotic;

w anyloid-beta fibril formation modulator; immune;

w alzheimer's disease; mild cognitive impairment;

w alzheimer's disease; mild cognitive impairment;

w alcomparate cognitive impairment;

w alcomparate cognitive impairment;

w acrebral amyloid angiopathy; hereditary cerebral haemorthage;

w age-related macular degeneration; hypothyroidism;

cerebrovascular disease; cardiovascular disease; memory loss; anxiety;

w behavioural dysfunction; neurological condition; psychological condition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure; Page 87; 143pp; English.

```
Recombinant polypeptides produced using the coding sequences of mutant forms of amyloid precursor proteins comprising from the 5' to the 3' end a sequence encoding a marker and either (1) a sequence encoding the N-terminus of an amyloid precursor protein (APP) up to, but not including, the nucleotides encoding the beta amyloid protein (BAP) domain or (2) the BAP domain; or the two ligated together, can be used to detect drugs or compounds that inhibit/augment the activity of proteolypic enzymes which cleave APP to generate BAP fragments (deposition of which occurs in patients with Alzheimers disease and Down's syndrome). This is a fragment of amyloid precursor protein containing a mutation which is associated with diseases involving BAP deposition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
with Lewy bodies, altered muscle tone, seizures, sensory loss, visual field deficits, incoordination, gait disturbance, transient ischaemic attack or stroke, transient alertness, attention deficit, frequent falls, synope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural haematoma, brain tumour, posttraumatic brain injury, or posthypoxic damage), or a psychological condition (e.g. depression, delusions, illusion, hallucination, sexual discorder, weight loss, psychosis, a sleep disturbance, insomnia, behavioural distinibition, poor insight, suicidal ideation, depressed mood, irritability, anhedonia, social withdrawal, or excessive guilt) in a subject e.g. human having a genomic mutation in an amyloid percursor protein gene, an ApoE gene, or a presentlin gene, having amyloid-beta deposits. The present sequence represents a beta-amyloid modulator peptide which is used in the exemplification of the

Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.
                                                                                                                                                                                                                                          Noctropic; neuroprotective; antifibrillogenic; amyloidosis inhibition; cytoprotection; amyloid deposit degradation; amyloidosis disorder; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; amyloid beta protein; beta-A4; memory enhancement; learning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human amyloid beta protein (beta-A4) peptide 12-20 SEQ ID NO:4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 30; DB 4; Length 9; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a fragment of the amyloid beta peptide. The invention relates to the use of peptide compounds for inhibition of polymerisation of amyloid beta peptide (ABP), as model substances for synthesis of ABP-ligands for inhibition of polymerisation of ABP, as a tool for the identification of other organic compounds with similar thool for the identification of other organic compounds with similar peptides may be used in treatment of amyloidosis, especially in treatment of Alzheimer's disease associated with amyloidosis, for treatment or prevention of demens in patients with Down's syndrome, for treatment or prevention of hereditary cerebral haemorrhage with amyloidosis (Dutch type) or for the prevention of fibrail formation of human amyloid protein. They can also be used for identifying other molecules with similar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   properties and/or as ligands for detection of amyloid deposits using e.g. positron emission tomography.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a novel peptide compound comprising Lys-
His-Tyr-beta-alanine, which has a memory modulating effect. The peptide
has nootropic activity. The peptide can be used for the development of
topographic models useful to design and synthesise memory-enhancing and
life-quality improving substances. The peptide compound restores the
balance between excitatory and inhibitory systems in the brain, which is
required for optimal acquisition and retention of learning and helps to
correct defects in the balance that arise as a result of aging,
infections and injury. The substances exert recybernaticising effects on
cervous system function and has more prolonged desired effects on
nervous system function and has more prolonged desired effects on
cervous system function and has more prolonged desired effects of
active peptides surtoures. The substances mimic the action of
active peptides without having a peptide structure and do not subject to
degradation of peptide-splitting enzymes in the gut or other tissues. The
present sequence represents a human amyloid beta protein (beta-A4)
peptide, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amyloid-beta40 inhibitor, Abeta40 inhibitor; cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                 New peptide compound useful for design of substances that enhance memory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptide #20, used as carrier for the amyloid-beta40 (Abeta40) inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral amyloid haemorrhagic trype and haemorrhagic stroke. The present sequence represents one of a group of peptides (AAU11648-AAU11669, AAU11910 & AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô
                                                                                                                                                              Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Analyzing cleavage of polymer, by providing polymer sample, incubating the sample with labeled isotope for cleavage at potential cleavage site, and analyzing the masses of any uncleaved fragments by mass spectrometry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mass spectrometry; polymer; analysis; cleavage; substrate specificity;

The present invention describes a method (M1) for analysing cleavage of a polymer. M1 comprises: (a) providing a sample of the polymer, a portion of the polymer molecules having been labeled at a position on one side of the potential cleavage site with a first isotopic label and a portion of the potential cleavage site with a scoond isotopic label; (b) concludating the sample under conditions suitable for cleavage at the potential cleavage site; and (c) analysing the mass(es) of any cleaved incubating the sample under conditions suitable for cleavage at the potential cleavage site; and (c) analysing the mass(es) of any cleaved conditions suitable for cleavage at the polymer by mass spectrometry and thereby determining whether and/or where cleavage has taken place. M1 is useful for analysing cleavage of a polymer, where the polymer is a linear polymer, and comprises a peptide or protein. Methods from the present invention can be used in discovaring cleavage of improved synthetic substrates for both known and unknown enzymes, c. g. enzymes identified from the human genome. The methods are also useful to identify the sequence origin, and in screening methods to identify new substrates for enzymes, in positional peptide scanning clibraries, in in vivo/ex vivo/in vitro peptide, and in assaying methods con polymerides or polymerdes are useful for monitoring the cleavage of polymerides or polymucleotides, and for determining optimal polymer substrates. Prevention and/or treatment of an amyloid-related disease e.g.

```
The invention relates to a method for prevention and/or treatment of an anyloid-related disease which comprises administration of an all-D-amyloid-related disease which comprises administration of an all-D-amyloid-bet apptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including to inflammatory diseases e.g. rheumatoid arthritis, juvenile chronic arthritis, ankylosing spondylitis, psoriatis, juvenile chronic arthritis, ankylosing spondylitis, psoriatis, syndrome and Crohn's Gisease. AA deposite are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus culers, chronic pyelonephritis, obserwabilitis and Whipple's disease). Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymboma, renal carcinoma of gut, lung and urogenital tract, basal cell carcinoma, carcinomas of gut, lung cand urogenital tract, basal cell carcinoma and hairy cell leukaemia. The

New amyloid beta peptide, useful for preparing a composition for preventing the formation or progression of amyloid plaques for preventing or treating Alzheimer's disease. Example 6; SEQ ID NO 135; 69pp; English.

The present invention describes an isolated amyloid beta peptide or its homologue which is selected by a method comprising: (a) determining the binding value of each amino acid of a subsequence of amyloid beta peptide upon binding to a HiA class I and/or class II molecule of interest; (b) determining the resulting score of all amino acids of the subsequence, based on the binding value of each amino acids obtained in step (1); and (c) comparing the resulting score to a preselected value. Also described: (1) a vaccine comprising the isolated amyloid beta peptide and a carrier

or diluent; (2) determining T-cell epitopes within amyloid beta peptide; (3) predicting the reaction of an individual to a vaccine; (4) matching a vaccine comprising a beta amyloid or homologue peptide to an individual, for immunisation of an individual based on the HLA haplotype of the individual; (5) a kit for matching a vaccine comprising amyloid beta peptide to an individual based on the HLA haplotype of the individual; and (6) preventing the formation or progression of amyloid beta mayloid beta peptide is useful for preparing a composition for preventing the formation or progression of amyloid plaques for preventing or treating Alzheimer's disease. The present sequence represents an amyloid beta (Abeta) peptide, which is used in an example from the present invention \$

Composition useful in radiopharmaceuticals for diagnostic imaging of thrombi comprises complex of radioisotope technetium with azadiaminedioxime ligand

Disclosure; Page 28; 50pp; English.

The invention relates to a novel composition comprising a complex of radioisotope technetium (Tc) with an aza-diaminedioxime ligand. The composition of the invention may be useful in radiopharmaceuticals for mammalian administration, to be used in diagnostic imaging of thrombi. The composition comprises minimised amounts of lipophilic technetium complex species, thus improving the overall imaging characteristics. The

composition does not form a diastereomeric complex as it does not contain a chiral centre and hence does not require purification of the particular isomers. The current sequence is that of the radioisotope technetium (TC) -related peptide 2 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that modulates amyloid-beta fibril formation or induces a prophylactic or

therapeutic immune response against amyloid-beta fibril formation; or fibril an immune system modulator that prevents or inhibits amyloid-beta fibril in a immune system modulator that prevents or inhibits amyloid-beta fibril conditions. Also described is a kit comprising (C: (C) have notropic, neuroprotective, cardiovascular, tranquilliser, corbital antithyroid, vasotropic, cardiovascular, tranquilliser, curopathic, anticonvulsant, anti-HIV antiparkinsonian, muscular, irranquilliser, neuropathic, antitdepressant, endocrine and hypnotic activities, and can be used as amyloid-beta fibril formation modulators, and as anyloid-beta related disease e.g. Alzheimer's disease (including sporadic (non-hereditary) or familial (hereditary); mild cognitive impairment, or familial (hereditary); mild cognitive impairment, or function and popathy, hereditary cerbral haemorrhage, senile dementia, own's syndrome, inclusion body myositis, age-related macular degeneration, or continence), a neurological condition (e.g. Huntington's disease, memory loss, anxiety, a behavioural dysfunction (e.g. Huntington's disease, anyloid states, altered muscle tone, seizures, sensory loss, vienal (including hypothyroidism, cerebrovascular disease, cardiovascular disease, apparasion, or incontinence), a neurological condition (e.g. Huntington's disease, appasia, apraxia, agnosia, pick disease, dementia with Lewy bodies, altered muscle tone, seizures, sensory loss, vienal field deficite, incoordination, gat disturbance, transient ischaemic, syncope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural haematcoma, brain tumour, posttramatic brain injury, or posthyyoxic damage), or a psychological condition (e.g. depression, delusions, a sleep disturbance, insommia, behavioural distinhibition, poor insight suicidal myloid-beta deposite. The present sequence represents a peptide that can be used as a vaccine antigen in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 amyloid-beta; amyloid-beta related disease;

The present invention describes compositions (C) comprising: (a) a first capture (ia) that prevente or treate amyloid-beta related disease; and (b) capture (ia) that prevente or treate amyloid-beta and (b) conditions and control or individual prevents or inhibits amyloid-beta control or individual control or corropic, neuroprotective, carebroprotective, heamostatic, control or anticonvolant, antichly, antiparkinsonian, muscular, tranquilliser, uropathic, anticonvolant, anticonvolant, anticonvolant, anticonvolant, muscular, tranquilliser, correction, cardiant, anticher and control or preventing or treating an amyloid-beta related disease e.g. Alzheimer's disease (including sporadic of and can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an amyloid-beta related disease e.g. Alzheimer's disease (including sporadic condition disease). Alzheimer's disease (including sporadic of mucloal and conditions associated with Alzheimer's disease.

CC (non-hereditary) or familial (hereditary), mild cognitive impairment, mild-to-moderate cognitive impairment, vascular dementia, cerebral amountage, senile dementia, comparation, or a condition associated with Alzheimer's disease.

CC (non-hereditary) or familian (hereditary) and desease, amony loss, anxiety, a behavioural dysfunction (e.g. apathy, disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, disease, memory loss, anxiety, a behavioural dysfunction (e.g. apathy, anytochyroiduses), and anytochyroiduse saleted muscle tene, seitzues, sensory loss, vital lateral selerosis, acquired immunodeficiency, succession, disease, apprended solementia, and deficits, incoordination, galt disturbance, translent isomentia, subdiction, and particular disease, and presented muscle tenes, seitzues, sensory loss, visual cience and condition, serve
                                                                                                                                                                                                                                                                                                                                                       Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; Page 95; 143pp; English.

```
The present sequence is that of an all-D peptide suitable for use for preparing vaccines for preventing or treating Alzheimer's disease and other amyloid-beta peptide (see AABS622), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues or non-amino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' peptides synthesised from the unnatural D-configuration amino acids to avoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at least 1 region of an amyloid protein, e.g. the beta-sheet region or GAG-binding site region, the amyloid-beta peptide, or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and immunogenic peptidemimetics. Examples include all-D peptides and immunogenic peptidemimetics. Examples include all-D peptides and immunogenic peptidemimetics. Examples include all-D peptides of in ABBS2613-64. The vaccine elicits a preferential TH-2 or TH-1 response, preventing fibrillogenesis and associated cellular toxicity. The amyloid related diseases may be localised amyloidosis, e.g. diabetes type II,
                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, eg. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and associated cellular toxicity.
                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Alzheimer's disease; amyloidosis; amyloid-related disease; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, eg. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and associated cellular toxicity.
neurodegenerative diseases, e.g. bovine spongiform encephalitis, Creuzzfeldt-Jakob disease, scrapie, cerebral amyloid angiopathy, and prion protein related disorders, or systemic amyloidosis associated with chronic infection (e.g. tuberculosis) or chronic inflammation (e.g. rheumatoid arthritis), familial Mediterranean fever (FMF) and systemic amyloidosis found in long-term haemodialysis patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is that of an all-D peptide suitable for use for preparing vaccines for preventing or treating Alzheimer's disease and other amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AABS2622), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' peptides synthesised from the unnatural D-configuration amino acids to avoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at least 1 region of a mayloid protein, e.g. the beta-sheet region or GAG-binding site region, the amyloid-beta peptide, or their immunogenic

                 immunogenic peptidomimetries. Examples include all-D peptides corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and 16-42 of the amyloid-betra peptide and the all-D derivative peptides given in AABB2623-64. The vaccine elicits a preferential TH-2 or TH-1 response preventing fibrillogenesis and associated cellular toxicity. The amyloid related diseases may be localised amyloidodsis, e.g. diabetes type II, neurodegenerative diseases, e.g. bovine spongiform encephalitis, Creutzfeld-Jakob disease, scrapie, cerebral amyloid angiopathy, and prion protein related disorders, or systemic amyloidoals associated with chronic infection (e.g. tuberculosis) or chronic infection (e.g. tuberculosis) or chronic infection (e.g. tuberculosis) familial Mediterranean fever (FMF) and systemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an amyloid-targeting imaging agent comprising an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New amyloid-targeting imaging agents useful for in vivo imaging amyloid plaques and/or for the treatment of amyloidosis disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

cc amyloid targeting moiety, a linker moiety and a labelling moiety. The agent is of general formula A.t.(A.in.k) z-A.ia_b (1) where z = 0 - 1; CC = a labelling moiety. All n.k = a linker moiety; and A.l.a.b (CC = a labelling moiety. Also included are imaging amyloid deposition or diagnosing an amyloid-related condition in a patient involving administering (I) to the patient, and ultrasound imaging (I) in the comprision of a myloid-related condition in a patient to determine the presence of amyloid or amyloid-related condition; and a kit for preparing a radiopharmaceutical preparation comprising (I), a reducing agent, a buffering agent, at transcholating agent, and (I), a reducing agent, and preparation and use of the radiopharmaceutical in the imaging of amyloid or an amyloid-related condition. The agents are used for imaging amyloid deposition and for diagnosing an amyloid related condition e.g. Creutzfeldt-Jakob disease (GDD), kuru, transmissible condition e.g. Creutzfeldt-Jakob disease (GDD), kuru, transmissible condition e.g. Creutzfeldt-Jakob disease (GDD), kuru, transmissible corphalopathy (BSE), inflammation-associated amyloid-related corphalopathy (BSE), inflammation-associated amyloid-type II diabetes, primary amyloidosis, Alzheimer's disease, prion-mediated diseases, cerebral amyloidosis, Alzheimer's disease, prion-mediated diseases, cerebral corphaphy dispathy. The agents are capable of crossing the blood-brain corpusation of the invention peptide forming the amyloid targeting moiety of the present sequence is a peptide forming the amyloid targeting moiety of the greent effects.

The invention relates to an amyloid-targeting imaging agent comprising an amyloid targeting moiety, a linker moiety and a labelling moiety. The agent is of general formula A.t.(A.l.n.K) z-A.l.a.b. [1] where z = 0 - 1; an amyloid targeting molety; Alon included are limper moiety; and A.l.a.b. a labelling moiety. Also included are limper moiety; and A.l.a.b. a labelling moiety. Also included are limper moiety; and A.l.a.b. a labelling moiety. Also included are limper moiety; and A.l.a.b. a labelling moiety. Also included are limper moiety; and A.l.a.b. a labelling moiety. Also included are limpering amyloid-related condition or administering (I) to the patient, and ultrasound imaging (I) in the patient to determine the presence of amyloid or amyloid-related condition. The agents and a kit for preparation and use of the radiopharmaceutical in instructions for the preparation and use of the radiopharmaceutical in the instructions for the preparation and use of the radiopharmaceutical in the instruction of amyloid deposition and for diagnosing an amyloid related condition. The agents are condition e.g. Creutzfeldt-Jakob disease (CDD), kuru, transmissible correptal amyloidoses (transmissible virus demantias), familial CDD, cerebral amyloidoses (transmissible virus demantias), familial CDD, primity amyloidosis, light chain-related amyloidosis, Alzheimer's disease, prion-mediated diseases, cerebral amyloidosis, Alzheimer's disease, prion-mediated diseases, myloid angiopathy. The agents are capable of binding specifically to amyloid plaques. The present sequence is a peptide forming the amyloid targeting moiety of the present sequence is a peptide forming the amyloid targeting moiety of the present equence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Amyloid-beta40 inhibitor; Abeta40 inhibitor; cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide #10, used as carrier for the amyloid-beta40 (Abeta40) inhibitor.
                             New amyloid-targeting imaging agents useful for in vivo imaging amyloid plaques and/or for the treatment of amyloidosis disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                 0
                                                                                                                                                   The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-betad of inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid haemorrhage with mayloidosis of the Dutch type and haemorrhage stroke. The present sequence represents one of a group of peptides (AAU11648-AAU11669, AAU11910 & AAU11911) that were used in the invention as a carrier for the amyloid-betad (Abetado) inhibitor. The Abetado inhibitor cerebral amyloid angiopathy (CAA)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for prevention and/or treatment of an amyloid-related disease which comprises administration of an all-D-amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta or fibril amyloid-beta from the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including inflammatory diseases e.g. rheumatoid arthritis, juvenile chronic
angiopathy, particularly Alzheimer's disease, hereditary cerebral hamozrhagic as troke. The amorathage with amyloidosis of the Dutch type and haemozrhagic stroke. The present sequence represents one of a group of peptides (AAU11648-AAU11669, AAU11910 & AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid angiopathy (CAA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 All-D-amyloid-beta peptide; Alzheimer's disease; rheumatoid arthritis; cerebral amyloid angiopathy; amyloid disease; ankylosing spondylitis; psoriasis; Reiter's syndrome; Adult Still's disease; Bechet's syndrome; Crohn's disease; infection; leprosy; tuberculosis; carcinoma; nootropic; chronic pyelonephritis; osteomyelitis; Whipple's disease; vasotropic; Hodgkin's lymphoma; neuroprotective; bronchiectasis; ophthalmological; ulcer; antiinflammatory; cytostatic; uropathic; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   an amyloid-related disease e.g.
use of all-D-amyloid-beta peptides.

The invention relates to a method for prevention and/or treatment of an amyloid-related disease which comprises administration of an all-D-amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. Cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta or fibril amyloid-beta from the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including
                                                                                                                                                                                                                                                                                               ô
arthritis, ankylosing spondylitis, psoriasis, psoriatic arthropathy, Reiter's syndrome, Adult Still's disease, Bechet's syndrome and Crohn's disease. AA deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectasis, decubitus ulcers, chronic pyelonephritis, osteomyelitis and Whipple's disease). Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodgkin's lymphoma, renal carcinoma, carcinomas of gut, lung and urogenital tract, basal cell carcinoma and hairy cell leukaemia. The present sequence is an Abeta peptide used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         All-D-amyloid-beta peptide; Alzheimer's disease; rheumatoid arthritis; cerebral amyloid angiopathy; amyloid disease; ankylosing spondylitis; psoriasis; Reiter's syndrome; Adult Still's disease; Bechet's syndrome; Crohn's disease; infection; leprosy; tuberculosis; carcinoma; nootropic; chronic pyelonephritis; osteomyelitis; Whipple's disease; vasotropic; Hodgkin's lymphoma; neuroprotective; bronchiectasis; ophthalmological; ulcer; antiinflammatory; cytostatic; uropathic; therapy.
                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Prevention and/or treatment of an amyloid-related disease e.g.
Alzheimer's disease, comprises use of all-D-amyloid-beta peptides.
                                                                                                                                                                                                                                                                                                   .

Gervais F, Bellini F; WPI; 2004-543342/52. Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.

Disclosure; Page 67; 143pp; English.

compositions (1) that prevents or treats amyloid-beta related disease, and (b) a gent (al) that prevents or treats amyloid-beta related disease, and (b) a gent (al) that prevents or interest amyloid-beta related disease, and (b) and assent as second agent (al) that is: (i) a peptide or peptidomiment that chemotation or induces a prophylactic or therapeutic immune response against amyloid-beta fibril formation; or therapeutic immune response against amyloid-beta fibril formation. Also described is a ktt comprising (C): (C) have noctropic, neuroprofective, crebroprofective, hasonstatic. (C) have noctropic, anticonvulsant, antidepressant, endocrine and hypnoric activities, and can be used as amyloid-beta fibril formation modulators, and as compthalmological, antidepressant, endocrine and hypnoric activities, and can be used as amyloid-beta fibril formation modulators, and as immunosial formation, and associated with Alzeimer's disease.

Complex syndromy loss, anxiety, a behavioural dysfunction (e.g. Huntington's agression, or incontinence), a neurological condition (e.g. Huntington's disease, amportanty loss, anxiety, a behavioural dysfunction (e.g. Huntington's disease, any ortrophic lateral sclerosis, acquired immunodeficit, frequent falls, attack or stroke, transient appression, agnosia, attention deficit, frequent falls, antide with Lewy bodies, alterad maucle tone, seizures, sensory loss, visual catack or stroke, transient appraxia, agnosia, attention deficit, frequent falls, and any deficite incompany neurological condition (e.g. depression, delusions, and sensor disease, amportope, neurological condition (e.g. depression, delusion), expendination, gall disturbance, reassion, behavioural disinhibition, poor insight, suicidal hamandan present invention describes compositions (C) comprising: (a) a first

The present invention describes compositions (C) comprising: (a) a first agent (a1) that prevents or treats amyloid-beta related disease; and (b) a second agent (a2) that is: (i) a peptide or peptidomimetic that medulates amyloid-beta fibril formation or induces a prophylactic or therapeutic immune system modulator that prevents or inhibite amyloid-beta (ibril formation; or (ii) an immune system modulator that prevents or inhibites amyloid-beta (ibril formation; Also described is a kit comprising (C). (C) have notropic, neuroprotective, cerebroprotective, haemostatic, ophthalmological, antithyroid, vasotropic, cardiovascular, ranquilliser, uropathic, anticonvulsant, antidepressant, endocrine and hyportic activities, and can be used as amyloid-beta fibril formation modulators, and as immune system modulators. (C) can be used for preventing or treating an amyloid-beta related disease e.g. Alzheimer's disease (including sporadic (non-bereditary) or familial (hereditary), mild cognitive impairment, mild-to-moderate cognitive impairment, vascular dementia, cerebral amyloid amyloid amyloid suppathy, hereditary cerebral hemorrhage, senile dementia, degeneration, or a condition abody myositis, age-related macular cognitive impairment, and disease, memory loss, anxiety, a behavioural dysfunction (e.g. Huntington's disease, memory loss, anxiety, a behavioural dysfunction (e.g. Huntington's disease, amyotrophic lateral sclerosis, acquired immunodeficiency, a prexis, apraxia, agnosia, pick disease, dementia with Lewy bodies, anxiety, a neurological condition (e.g. Huntington's subdural catack or stroke, transient alertness, attention deficit, frequent falls, syncope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural chaematoma, brain tumour, postrandar brain injury, or postraposic, allandar in acyal injury, or postraposic, allandar injuration as any allandar and any allandar any allandar and any allandar and any allandar and any allandar and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      damage), or a psychological condition (e.g. depression, delusions, damage), or a psychological condition (e.g. depression, delusions, a sleep disturbance, insomnia, behavioural disonthabition, poor insight, asicidal ideation, depressed mood, irritability, anhedonia, social withdrawal, or excessive guilt)) in a subject e.g. human having a genomic mutation in an amploid precursor protein gene, an ApoE gene, or a presentin gene, an having amyloid-beta deposits. The present sequence represents a peptide that can be used as a vaccine antigen in the exemplification of the
                                                                                                                                                                                                                                                                                                                                    Composition for treating e.g. Alzheimer's disease comprises first agent that prevents or treats amyloid-beta related disease and second agent that is either a peptide or peptidomimetic or an immune system modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; Page 67; 143pp; English.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed considerably techniques to reserve normal cativity of (II) or to treat disease states involving (II). (II) is cuseful for generating antibodies against it, detecting or quantitating a cupplement. (II) and its binded and as a food cupplypeptide in tissue, as molecular weight markers and as a food cupplypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations of supplements. (I) and (II) are useful for treating disorders convolved to polypeptide and polymucleotide sequences and products dependent on DNA and and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in celetronic format directly from WIPO at the polyperion of the printed specification, but was obtained in celetronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

```
preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, eg. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and associated cellular toxicity.
                                                                                                                                                                                                                             peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
                                                                                                                                      Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Alzheimer's disease; amyloidosis; amyloid-related disease; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48486 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nootropic; neuroprotective; antifibrillogenic; amyloidosis inhibition; cytoprotection; amyloid deposit degradation; amyloidosis disorder; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.

                                           preparation systems for preventing or treating Alzhaimer's disease and other amyloid related disorders in humans. It is based on a portion of amyloid related disorders in humans. It is based on a portion of amyloid related disorders in humans. It is based on a portion of inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues or non-amino acid fragments. Vaccines of the invention acid residues or non-amino acid fragments. Vaccines of the invention acid residues or non-amino acid fragments. Vaccines of the invention acid residues or non-amino acid fragments. Vaccines of the invention acid residues or non-amino acid fragments. Vaccines of the invention acid residues or non-amino acid fragments are produced using 'non-aelf' of avoid the drawbacks of 'self' proteins. They preferably interact with at least 1 region of an amyloid protein. G. the beta-sheet region or GAG-binding alte region, the amyloid-beta peptide or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and immunogenic peptidemimetics. Examples include all-D peptides and immunogenic peptidemimetics. Examples include all-D peptides and in AABB3C13-64. The vaccine elicits a preferential TH-2 or TH-1 response, in AABB3C2-64. The vaccine elicits a preferential TH-2 or TH-1 response, in AABB3C2-64. The vaccine elicits a preferential TH-2 or TH-1 response, or elated diseases may be localised amyloidosis, e.g. diabetes type II, neurodegenerative diseases, scrapie, cerebral amyloid angiopathy, and prion protein related disorders, or systemic amyloidosis associated with chronic infection (e.g. tuberculosis) or chronic infammation (e.g. tuberculosis) or chronic infammation (e.g. tuberculosis) or thronic infection derivative between the angelosis associated with the angles and application and the all-2 and and application and systemic and systemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                  present sequence is that of an all-D peptide suitable for use for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The preparing vaccines for preventing or treating Alzheimer's disease and other amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AABB2622), and may be modified by removing or inserting 1 or more amino acid residues, or by substituting 1 or more amino acid residues, or by substituting 1 or more fragments. Vaccines of the invention are produced using 'non-self' crayments. Vaccines of the invention are produced using on anion acid cavoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with a fragments, protein conjugates, immunogenic. They preferably interact with a care least 1 region of an amyloid protein, e.g. the beter select region or GAG-binding site region, the amyloid-beta peptide, or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and a AABB2623-64. The vaccine elicits a preferential Thi-2 or TH-1 response, in AABB2623-64. The vaccine elicits a preferential toxicity. The amyloid crafted diseases may be localised and the all-D derivative peptides given in AABB2621-64. The vaccine elicits a preferential toxicity. The amyloid crelated diseases, e.g. bowine spongiform encephalitis, cleared diseases, e.g. bowine spongiform encephalitis, crelated diseases, e.g. bowine spongiform encephalitis, chucin infection (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic infection are thermatical arthritis) and systemic and the and a second and a secon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
Preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, eg. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and associated cellular toxicity.
                                                                                                                                                                                                                                                    sequence is that of an all-D peptide suitable for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gape

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                        The invention relates to an amyloid-targeting imaging agent comprising an amyloid targeting moiety, a linker moiety and a labelling moiety. The agent is of general formula A.t. (A.l.n.k) z.A.l.a.b. [1] where z = 0 - 1; A.t. = an amyloid targeting moiety. A.l.n.k = a linker moiety; and A.l.a.b. [2.A.t. = an amyloid targeting moiety. A.l.n.k = a linker moiety; and A.l.a.b. [2.A.t. = an amyloid related condition in a patient involving administering (1) to the patient, and ultrasound imaging (1) in the patient to determine the presence of amyloid or amyloid related condition or a and a kit for preparation and ultrasound imaging (1) in the condition for the imaging agent, a buffering agent, a transchelating agent, and instructions for the preparation and use of the radiopharmaceutical in the inacting of amyloid deposition amyloid-related condition. The agents are used for imaging amyloid deposition and for disquosing an amyloid related condition e.g. Creutzfeldt-Jaxob disease (CUD), kuru, transmissible created condition e.g. Creutzfeldt-Jaxob disease (CUD), kuru, transmissible created to primary amyloidosis, felline spongiform encephalopathy (BSB), inflammation associated amyloidosis, felline spongiform encephalopathy, ton-transmissible created amyloidosis, felline spongiform encephalopathy, ton-transmissible created amyloidosis, light chain-related amyloidosis, light chain-related amyloidosis, amyloid angiopathy. The agents are capable of crossing the blood-brain charrier and are capable of binding specifically to amyloid plaques. The greent sequence is a peptide forming the amyloid targeting moiety of the present sequence is a peptide forming the amyloid targeting moiety of the constitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                     New amyloid-targeting imaging agents useful for in vivo imaging amyloid plaques and/or for the treatment of amyloidosis disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid haemorrhage of the modern type and haemorrhagic estroke. The present sequence represents of the Dutch type and haemorrhagic estroke. The present sequence represents one of a group of peptides (AAVI1648-AAVI1669, AAVI1910 & AAVI1911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid anglopathy (CAA)
                                                                                                                                                                                                                                                                   Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40 inhibitor.
        Amyloid-beta40 inhibitor, Abeta40 inhibitor; cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amyloid-beta40 inhibitor; Abeta40 inhibitor; cerebral amyloid angiopathy; CAA; nootropic; neuroprotective; cerebroprotective; Alzheimer's disease; cerebral haemorrhage; amyloidosis; haemorrhagic stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide #9, used as a carrier for the amyloid-beta40 (Abeta40) inhibitor.

The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral haemorrhage with amyloidesis of the Dutch type and haemorrhagic stroke. The present sequence represents one of a group of peptides (AAU11618 AAU11911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by
                                                                                                                                                                                                                                                                                                            Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40 inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              All-D-amyloid-beta peptide; Alzheimer's disease; rheumatoid arthritis; cerebral amyloid angiopathy; amyloid disease; ankylosing spondylitis; psoriasis; Reiter's syndrome; Adult Still's disease; Bechet's syndrome; Crohn's disease; infection; leprosy; tuberculosis; carcinoma; nootropic; chronic pyslonephritis; osteomyalitis; Whipple's disease; vasotropic; Hodgkin's lymphoma; neuroprotective; bronchisectasis; ophthalmological; ulcer; antiinflammatory; cytostatic; uropathic; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                        The invention relates to a method for prevention and/or treatment of an amyloid-related disease which comprises administration of an all-D - amyloid-beta peptide. The method is used for preventing and/or treating and/or disease of all preventing and/or treating and/or disease of anyloid-beta in amammal and angiopathy; for altering serum levels of amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta in a mammal and cavours the clearance of soluble amyloid-beta in amyloid-beta from the mammal; and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including and unitarity, anxylosing spondylitis, peoriasis, juvenile chronic arthritis, anxylosing spondylitis, peoriasis, juvenile chronic microbial chieses. AA deposits are also produced as a result of chronic microbial infections (preferably leprosy, tuberculosis, bronchiectesis, decubitus infections (preferably leprosy, tuberculosis, bronchiectesis, decubitus cucers, chronic pyelonephritis, osteomyelitis and Whipple's disease).

Certain malignant neoplasms can also result in AA fibril amyloid deposits including Hodykin's lymphoma, renal carcinomas of gut, lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

disease, amyotrophic lateral sclerosis, acquired immunodeficiency,
Parkinson's disease, aphasia, apraxia, agnosia, Pick disease, dementia
with Lewy bodies, altered muscle tone, selzures, sensory loss, visual
field deficits, innocordination, gait disturbance, transient ischaemic
attack or stroke, transient alertness, attention deficit, frequent falls,
syncope, neuroleptic sensitivity, normal pressure hydrocephalus, subdural
heematoma, brain tumour, posttraumatic brain injury, or posthypoxic
damage), or a psychological condition (e.g. depression, delusions,
illusion, hallucination, sexual disorder, weight loss, psychosis, a sleep
disturbance, insomnia, behavioural disinhibition, poor insight, suicidal
cideation, depressed mood, irritability, anhedonia, social withdrawal, or
excessive guilt) in a subject e.g. human having a genomic mutation in an
amyloid precursor protein gene, an ApoE gene, or a presenilin gene;
having amyloid-beta deposits. The present sequence represents a peptide
that can be used as an antifibrillogenic amyloidosis inhibiting peptide
in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
